DOCKER SUMMIT 2026

Agents as colleagues

A local AI team with Hermes Agent, running in Docker Sandboxes

MARCO FRANZON · DUALISTIC

THE DESK

You know sbx.
Meet who lives in it.

```
$ sbx run --kit docker.io/sbx/hermes-agent-kit:latest hermes-agent
```

THE AGENT

Hermes Agent lives in your chat but not your terminal

Gateway

Slack, Telegram, Discord, WhatsApp, Signal, email

Memory

Remembers you and your projects across sessions

Skills

Writes new skills from experience and improves them with use

Cron

Scheduled jobs that report back in your chat

THE TEAM

Every profile is a colleague with a name

CO

@plinius

Reviews PRs and fixes the flaky test

OP

@tom

Watches the logs and pings #infra

Each has its own bot account, personality (SOUL.md), memory and cron jobs.

ONBOARDING

Hiring a colleague: a SOUL.md and three commands

~/.hermes/profiles/plinius/SOUL.md

You are Plinius, a careful backend engineer.
Keep pull requests small.
Run the tests before you say "done".
Ask before touching main.

inside the sandbox

```
hermes profile create plinius
# a new, isolated agent

plinius setup
# model + its own bot token

plinius gateway start
# he joins the chat
```

WHY THIS COMBO

Hermes' best features

Hermes gives you	On a bare laptop	In a Docker Sandbox
Always on, in your chat	A shell anyone in chat can prompt	A shell inside a microVM
Cron: works while you sleep	Unattended runs with your creds	Unattended, and walled off
Skills it writes itself	**Its own code, running as you**	**Its own code, running in a VM**
Real API access	Keys in a .env it can read	Keys it never sees

Give your agents a desk, not your keys.
